"Toutes choses divines" - this project is the first book I did for andromede Full color and black and white images on super soft vellum and printed in a limited edition of 300 signed

A: The function you are looking for is rvest::html_table(my_table, print = TRUE). This will give you the first 3 lines of your table. From the rvest manual: html_table(x,...) ... Prints a table of the results of the tidy() and html() calls on the data frame (object) x. Given the way the aging process unfolds in the human body, fertility treatments that work better when you are young aren't necessarily what you need when you get older. For example, in vitro fertilization (IVF) is highly effective for women under 40, but there is little to no chance of it succeeding for women in their 40s and beyond. Doctors can try to adjust the stimulation protocol and other factors to make sure the eggs being harvested are as young as possible, but that will only add months to the treatment process rather than a few years. What if there was a pill that could make your eggs "younger?" Does age really matter? There's a few reasons why some scientists think women may have a higher risk of conceiving with older eggs than younger eggs. Specifically, the risk of twins increases with age. Most IVF programs utilize a version of a split-dose protocol. This means that as doctors harvest more and more eggs, they stimulate the ovaries less and less. And when women who are going through IVF get to the point of ovulating, they are most likely to produce more than one egg. One egg that's older than the other, and they tend to be less likely to stay together in the fallopian tube when the egg meets the sperm. When this happens, the older egg is more likely to fertilize with the sperm, and the other egg may never get fertilized. That's why, if the older egg fails to fertilize, it will be more likely to appear in the fallopian tube again. If the older egg fertilizes and implants in the uterus, the younger egg will be more likely to develop and keep growing through pregnancy and childbirth. It's also possible that doctors could harvest more eggs than they actually need, which is the case for women in their 40s and above. And even if they did the math and focused only on the egg that' f678ea9f9e
